

The HD Screw Compactor is a proven and highly efficient machine. On this system the screw compaction unit is located at the lower end of the machine and packs into the bottom of the waste bin. This system is ideally suited to slightly denser waste material than the High Lift compactor where the machine is powerful enough to get the maximum waste into the container without the need to pack into the top of the bin.

Both the HD and HL Screw Compactors can be tailor made to customer requirements, in the form of fully enclosed standalone units, to off the dock designs allowing the machine to extend from existing loading bays. This machine is also available with either SP or SPN screw units.
